

Program Execution Tracking “Pro” Tool

This tool allows to follow the execution of a program in an easy way to detect “bugs” or misbehavior. To show it, press the **OPT**, touch the “Program” menu button, and then select the “Program Debug” tool.

When this tool is used together with the “Show Registers” set to “ON” (in the “System -> [General Settings](#)” option), you can follow step by step the program logic and calculations in an easy direct way. Also, you can “Undo” the last executed program line leaving the memory content as it was in the previous step.

The understandable instruction labels, the “Execute” or “Undo” a program step, gives you an invaluable functionality at program testing stage.
